# More apps. More possibilities. More security.

Mobile Devices – the number 1 security challenge

Smartphones, tablets and co. have all become an integral part of our everyday lives. They allow us to work from any location and at any time. However, the devices that are used and the apps installed on them represent an attractive gateway for data thieves and hackers.
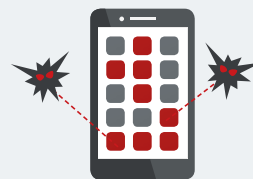

It is far easier for internal information and sensitive corporate data to end up in the wrong hands via these devices than with any other kind. This means they represent the biggest element of uncertainty in IT landscapes for the companies.

Mobile Application Management – APPVISORY, the number 1 solution

APPVISORY is Europe's leading mobile application management software. The SaaS solution is developed and hosted in Germany, and offers support in German and English. It enables employees to work securely and productively in an environment that is known from private use. You save on IT resources and costs and prevent severe fines related to the new data protection regulations.

140 billion apps were downloaded from the App Store alone in 2016. In 2014 it was only around half this amount. This extremely rapid rise can continue to be expected in the future, as the market for mobile applications is continuing to grow, providing users with an enormous amount of usage possibilities.

However, this large selection of apps also brings new risks with it. Data theft and attacks on the privacy of individuals are longer a rarity. Apps are clearly a gateway for problems, which potentially enable attacks from third parties or only provide an insufficient level of protection. These or similar security gaps can be found in around half of all apps.

Compliance and Data Security

APPVISORY checks apps, both in relation to data security as well as compliance factors, and ensures your corporate policies are implemented on all of your mobile devices.

APPVISORY®
by mediaTest digital

Does your company want to optimize all aspects of mobile work?

This is how you protect corporate data on your mobile devices.
APPVISORY shows you which apps include significant risk potential and which ones are unproblematic. Two test methods:
App Scan – fully automated scan technology, large number of fast test results
Expert Analysis – Semi-automated test by the App Security Analysts for especially critical apps
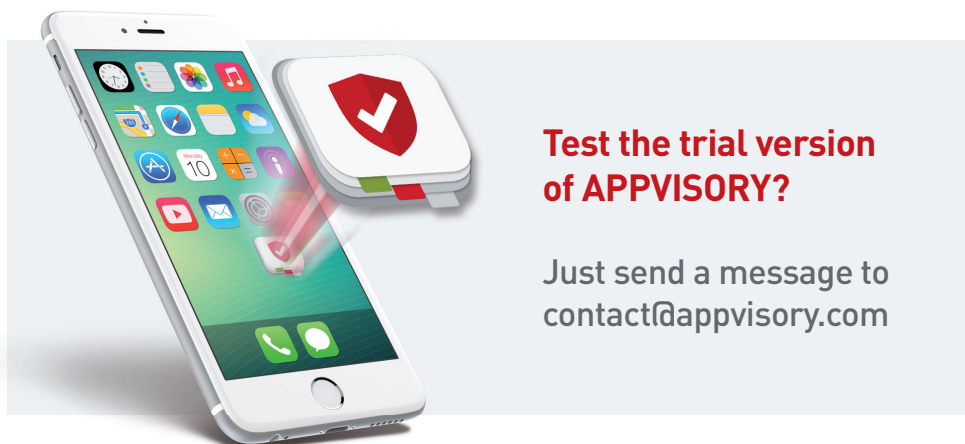

Protect your mobile devices against viruses and malware.
APPVISORY automatically scans all installed apps for malware and viruses in real time. The SAVAPI virus scanner from the German market leader Avira is fully integrated in the test technology.

Implement your security policies on mobile devices as well.
The APPVISORY configuration assistant helps you to define your own security policies quickly and intuitively, and delivers a comprehensive portfolio of checked apps based on your individual settings. The configuration can be completed in less than 30 minutes. The Professional Service from APPVISORY supports you competently and reliable at all times.

Test the trial version of APPVISORY?
