ENgage!™

"Mature Service Desks Require Clear & Audited Trails of Communication. Email Alone Doesn't Fit This Model"

WHAT IS ENgage!?

ENgage! rapidly notifies your Service Subscribers of reported or upcoming works and service outages to improve the perception of your department and to avoid heavy loads on the desk at the time when you need all-hands-on-deck.

We live in a world where communication is taken for granted, yet the methods of communication we use for some of our most vital services have barely changed in two decades. When our Service Desk needs to communicate, all too often we rely on email or a banner on our Self-Service page; but our customers are overwhelmed with emails and by the time they see something on the Self-Service page they have already been impacted. Besides, how do we tell people email is down if we can't email them?

It's time to do things a better way.

With a powerful API, Service Desk Integration points allow for messages to be triggered by service desks including (but not limited to) **Ivanti Service Manager and Ivanti Service Desk.** Dynamic actions allow for end-user responses to be interactive, such as Change Management Board approvals without having to access the full service desk console. The result simplifies the process and encourages greater participation.

Designed so that those that need to communicate can do so without the need to understand everything behind the scenes; ENgage! is not just a tool for I.T. it is a solution for the whole Enterprise.

Anticipate Disruption, Alert User Community, Accelerate Response and Resolution

Our inboxes are filling more and more with email, and important communications can become lost or severely delayed in their reading. Even when read, the user is often required to log into a different interface to perform whatever action is required of them further increasing delays and frustrations.

With ENgage!, important and time-critical communications can be delivered via an independent and fully auditable mechanism.
Dynamic messages allow for templates to become unique messages based on the contents of your Service Desk or other originating system.

Actionable Buttons require acknowledgement or even a decision that itself can initiate an action based on the end users' choices.

HOW DOES IT WORK?

Using the ENgage! HTML5 interface or powerful web service API allows for maximum flexibility.

Machine and User based targeting is available to notify the right people or groups with ease even supporting multi-user systems and time zone aware operation.

Built upon the powerful and proven architecture of State Management, ENgage! gives you unparalleled levels of interaction with a clear and reportable audit trail.

WHO DOES IT BENEFIT?

Axensia's multi-tiered approach enables ENgage! to benefit everyone including (but not limited to):

Service Desk
· Notify support team of Severity 1 or Major Incidents
· Notify support managers of VIP logged incident

Supporting Company Departments
· Facilities Management/Finance/HR/Sales
· Schedule reoccurring tasks for groups of employees
· Link directly to web pages for benefits enrollment, signup pages
· Conduct surveys and provide results

System Administrators
· Notify of company-wide outages and communicate estimated restore times.
